

# Rodent Activity Wheel

Activity Wheel is an easy way to quantify rodent voluntary activity in their home cage environment over long periods of time. Instrument can be used to perform a wide range of measurements, including: wheel revolutions, average/min/max speed, acceleration, utilization time. Instrument is used for research on circadian rhythms, motor function, aging, energy balance, recovering and pain related exercise. Different models are available for mouse and rat.

**Designed To Quantify Rodent Voluntary Activity In Their Home Cage Environment Over Long Periods Of Time**
